METHODOLOGICAL NOTES

Population

Population estimates as of the beginning of year (period) in years between censuses are made on the basis of the most recent population census results, taking account of the current registration of demographic events.

Resident population are persons permanently resident in a particular area as well as foreign nationals and persons without citizenship temporarily resident in this area for one year and more.

Migration is a physical movement of individuals from one area to another related to the changing of the place of residence.

Number of arrivals is the number of persons who arrived in a particular area from another area for permanent or temporary (one year and more) residence over a reference period.

Number of departures is the number of persons who left a particular area for another area for permanent residence over a reference period.

Migration gain is equal to the difference between the numbers of arrivals and departures over a reference period. Migration gain may have a positive value if the number of arrivals exceeds that of departures, or a negative one (migration loss) if the number of departures exceeds that of arrivals.

Employment and unemployment

Population employed in the economy (further referred to as **employed population**) – persons in paid employment or performing some work for profit or gain, and also persons temporarily not at work. Unpaid family workers or relatives are included.

Unemployed registered with agencies for labour, employment and social protection – persons of working age, permanently resident in the Republic of Belarus and having no work or earnings, who are registered with agencies for labour, employment and social protection at the place of their permanent residence for work search, are seeking work, and are available for work.

Registered unemployment rate – a ratio of the number of unemployed registered with agencies for labour, employment and social protection to the number of labour force (employed and unemployed registered with agencies for labour, employment and social protection).

Standard of living

Money incomes of population include compensation of employees, income from entrepreneurial activity and other income-generating activities, transfers to the population (pensions, benefits, scholarships and other transfers to the population), property income (interests on deposits, dividends, and other income from property), other income (winnings on lotteries, income from sale of recyclable materials and etc.).

Disposable money incomes of population are money incomes of population remaining in hand after taxes, fees and duties.

Real disposable money income of population is a relative statistical measure calculated by dividing the nominal growth rates of disposable money incomes of population by the consumer price index of goods and services for a corresponding time period.

Per capita money income is calculated by dividing the total money income of the population by the average annual population.

Nominal gross average monthly wages and salaries are calculated as a ratio of the gross payroll, including income tax and compulsory insurance contributions of employees, to the average payroll number of employees taken to calculate the average wages and salaries and by the number of months in the period.

Real wages and salaries are a relative statistical indicator characterizing the purchasing power of wages and salaries in the reference period due to the changes in prices for consumer goods and services as compared with the base period; calculated by dividing the index of nominal gross wages and salaries by the consumer price index for the same time period.

Average pension size is defined by dividing the total amount of pensions granted by the number of pensioners.

Real monthly pensions characterize the purchasing power of pensions granted in the reference period as related to the price changes of consumer goods and services in comparison with the base period. For this, real pension index is calculated by dividing the average pension index by the consumer price index for the same time period.

Gross domestic product

Gross domestic product (GDP) is the value of goods and services produced in an economy by all economic activities and intended for final consumption, capital formation and net exports.

GDP can be calculated at current prices (nominal GDP) and constant prices (real GDP).

GDP deflator index is the price index of all final goods and services the value of which is included in the GDP of the country. It is a ratio of the nominal GDP at market prices of the current year to the real GDP at the prices of the base year.

GDP by production approach is calculated as a sum of gross values added of all economic activities and net taxes on products (taxes on products less subsidies on products).

Gross value added is the output less intermediate consumption; calculated by economic activities.

Taxes on products are taxes payable proportionally to the quantity or value of goods and services produced and sold or imported by resident units.

Subsidies on products are subsidies given for a unit of a good produced or service provided, that is proportionally to the quantity or value of produced and sold goods and services or those imported by resident units.

Industry

Volume of industrial production measures the total output of finished products, work performed and services provided by the personnel of organisation according to the National Classification of Economic Activities, classified under Mining and Quarrying, Manufacturing, Electricity, gas, steam, hot water and conditioning supply; Water supply; waste management and remediation activities.

The total volume of industrial production includes data on industrial outputs of legal entities (small business entities, large and medium-sized organisations), their kind of activity units, individual entrepreneurs and households regardless of the ownership type, which produce goods (works, services) in mining and quarrying, manufacturing, Electricity, gas, steam, hot water and conditioning supply; Water supply; waste management and remediation activities.

Index of industrial production is a relative measure of changes in the outputs in the periods under comparison. The index of industrial production is computed using the production dynamics of representative goods and is based on the calculation of individual production indices of specific industrial products with their further step-by step aggregation into production indices by economic activities and the index for the industry as a whole. The structure of gross value added by economic activity for a base year is used here as weights for aggregation.

Industrial output in physical terms is defined as total kinds, types and brands of industrial products. It is recorded according to the specific nomenclature and in corresponding units of measurement. Data on industrial output in physical terms are shown on the basis of gross output, i.e. including products used within organisations for own industrial and production needs as well as manufactured under contracts from materials supplied by customers.

Agriculture

Agricultural production is the total value of material wealth created in the sector both for sale and for own consumption. Agricultural production comprises the value of animal husbandry products and crop products, including the value of work-in-progress in crop growing.

Farms of all types include:

agricultural organisations – legal entities (except private (peasant) farms) and their local units keeping separate balance sheet accounts with the principal and/or secondary economic activity in agriculture, excluding providing services in animal husbandry products and crop products;

private (peasant) farms;

household plots.

Agricultural production index is a relative statistical measure of changes in the volumes of agricultural production in periods under comparison (at constant prices).

Livestock population is the number of farm animals – cattle, pigs, sheep, goats, horses and other.

Sales of livestock and poultry for slaughter (in live weight) means livestock and poultry sold for slaughter through all distribution channels, i.e. to meat processing factories and cold storage plants; subsidiary production units; consumer cooperation organisations; distributed or sold through catering facilities; sold at markets and through other distribution channels.

Milk production is actually yielded milk, including milk used for farm needs. Milk production does not include milk suckled by suckling calves.

Production of eggs is eggs gathered from all kinds of farm poultry, including eggs used for poultry reproduction (incubation), production of egg powder, etc. as well as egg loss (breakage, spoilage, etc.).

Fixed capital investment and construction

Fixed capital investment represents total costs directed to acquisition, replacement and creation of new fixed assets. Fixed capital investment data include investment activities of small business entities that are legal persons. According to the technological structure, fixed capital investment is classified into the following work activities and costs: building and assembly; assembly of equipment; acquisition costs of machinery, equipment, transport vehicles, tools and implements; other works and costs.

Fixed capital investment out of foreign sources consists of foreign investment in fixed capital and investment in fixed capital drawn on foreign lines of credit.

Foreign fixed capital investment refers to funds received by organisations from abroad directly from foreign investors, including funds disbursed as foreign gratuitous aid by non-residents of Belarus; equipment received from abroad under leasing agreements under the terms of lease asset; contributions to the authorized fund of organisations made by foreign investors in the form of machinery and equipment, transportation; undistributed part of net profits of a foreign investor reinvested in the objects of investment activities (on purchase, reproduction and creation of new fixed assets) and credits (loans) of foreign banks (credits (loans) extended by indirect investors under direct agreements, against the guarantee of the Government of the Republic of Belarus, against bank guarantee, on mortgage, recognizance or under other terms, i.e. credits (loans), the liabilities to non-residents under which are recorded on the balance-sheets of organisations).

Credits on foreign lines of credit are bank credits on foreign credit lines received by organisations via the banks of the Republic of Belarus from non-resident banks to implement investment projects.

Volume index of fixed capital investment is a relative statistical measure defined as the ratio of fixed capital investment in the reference period to the base period at constant prices.

Commissioning of residential buildings in terms of total floor space includes total floor space of apartments of residential buildings, residence halls and living quarters in other buildings intended for private habitation, or to be used as work-related living quarters, and are subject to inclusion in the housing stock upon commissioning.

The **total floor space of residential buildings** is defined as a sum of total floor spaces of apartments in these buildings. The total floor space of apartments comprises the sum of floor spaces of habitable rooms, auxiliary rooms, built-in closets, as well as summer rooms (loggias, balconies, verandahs, terraces), and cold store-rooms, to which corresponding reduction factors are applied.

Transport and communications

Freight transportation is the volume of freight transportation in tones.

Freight transportation by motor road transport reflects data on commercial freight transportation by enterprises and individual entrepreneurs.

Freight turnover is the volume of transport operation of cargo carriage. The unit of measurement here is ton-kilometers, i.e. carriage of one ton of cargo to the distance of one kilometer. It is calculated by summing up weight, in tons, of each consignment multiplied by the distance in kilometers.

Freight turnover of pipeline transport is the volume of conveyance of oil, oil products and gas via transition pipeline. It is measured by summing up gross tons (cubic meters) of products (oil, oil products and gas) taken over at the border of Belarus multiplied by the distance of transportation over the territory of Belarus to a filling point, oil storage depot, refinery, or gas distribution system.

Passengers transported (volume of passenger transportation) is the number of passengers transported over a specified period of time. Data on passenger transportation include passengers enjoying the right to free-fare travel.

Passenger turnover is the volume of transport operation of passenger conveyance. The unit of measurement here is passenger-kilometer, i.e. the conveyance of a passenger to the distance of one kilometer. It is measured by summing up the number of passengers for each transportation multiplied by the distance in kilometers.

Postal and courier activities. Telecommunication activities

Income from postal and courier activities is the money amount charged for the total postal and courier services provided according to the effective tariff rates.

Income from telecommunication activities is the money amount charged for the total telecommunication services according to the effective tariff rates.

Trade and services

Retail turnover is the value of goods sold to the population for personal, family, household or other similar use not related to entrepreneurial activities, for cash or paid by bank cards, e-money, bank transfers from personal accounts, or by other cashless method of payment.

Catering turnover is the value of goods of catering trade sold to the population, legal entities and individual entrepreneurs for cash and (or) non-cash payments through catering outlets or out of catering outlets by orders.

Volume index of retail and catering turnover is a relative measure of dynamics expressed as a percentage which characterizes changes in the turnover over time assuming that the prices in the reference period did not change compared with base period.

Volume of paid services for population reflects the volume of different types of services consumed by the population and is measured in terms of total money amounts paid by individuals or by their employers (out profits) for the services supplied.

Prices and tariffs

Consumer price index is one of the measures of inflation characterizing changes over time in the value of a fixed consumption basket of goods and services purchased by the population for non-production consumption.

Industrial producer price index reflects price dynamics of domestically produced industrial goods (services) shipped to the domestic market. Industrial producer price index is calculated on representative goods in the sampled network of reference organisations which are the most typical for the country's industry and which to the highest extent reflect its current structure.

Price index in construction characterizes price changes of material and technical resources used in investment activities related to investment in fixed capital. Price index in construction is calculated by the Ministry of Architecture and Construction of the Republic of Belarus on the basis of the aggregate price index of building and assembly work activities taking account of price index of assembly and installation of technological equipment, aggregate price index of equipment, and price index of other work and costs, these indices being weighted according to the share of components of technological structure of fixed capital investment.

Freight tariff indices allow for measuring changes over time in tariffs of freight transportation. A representative service tariff is recorded for each mode of transport. A representative service of freight transportation by different modes of transport means the carriage of one ton of the most bulk cargo to the specified distance.

Tariff index of communications services for legal persons and individual entrepreneurs reflects general changes over time in tariffs of postal and telecommunication services for different user groups.

Agricultural producer price index measures price changes of selected domestically produced agricultural products sold on the domestic market. Agricultural producer price index does not include value-added tax and transportation and handling costs, but includes allowances and discounts for quality.

Foreign investment

Foreign investment is investment made by foreign investors. It can be classified into direct, portfolio, and other investment.

Foreign direct investment is investment made by direct investors whose equity position is at least 10 percent of shares and/ or stocks in the statutory fund of organisation.

Foreign portfolio investment is investment in the form of shares and/ or equities making up less than 10 percent of the statutory fund of organisation, promissory notes (except commodity-backed) and other debt securities

Other foreign investment comprise credits and loans, financial leasing, accounts and deposits

Net foreign direct investment (excluding liabilities to direct investor for goods, works and services) is the amount of net foreign direct investment (excluding liabilities to direct investor for goods, works and services) in the real sector of the economy, banking sector, and acquisition of immovable property by non-residents from residents of Belarus.

Net foreign direct investment (excluding liabilities to direct investor for goods, works and services) in real sector of the economy are calculated as the inflow of foreign direct investment (excluding liabilities to direct investor for goods, works and services) less foreign direct investment withdrawn (excluding liabilities to direct investor for goods,

works and services); the value obtained is adjusted for organisations whose capital stock (shares in the statutory fund) was owned by the government and then sold to non-residents of Belarus.

Foreign trade

The data on foreign trade in goods and services have been compiled by the National Bank of the Republic of Belarus in compliance with the sixth edition of the Balance of Payments and International Investment Position Manual (IMF 2009).

The National Statistical Committee of the Republic of Belarus has compiled statistical data on **foreign trade in goods** in compliance with the Methodology for the compilation of statistical indicators of foreign trade in goods of the Republic of Belarus approved by the regulation of the National Statistical Committee of the Republic of Belarus No. 27 of May 7, 2013. Data on the imports of oil, gas condensate, electricity, data on the exports of oil, gas condensate, electricity, caprolactam, nitrogenous and potassium fertilizers and data on the exports and imports of bunker fuel used for filling aircraft are compiled on the basis of state statistical reports. Exports and imports of selected commodities not covered by customs statistics are estimated with the balance method using the data of the sample household living standards survey and other sources

Exports reflect the outflow of goods from the territory of Belarus, which subtracts from the stocks of material resources of the country; **imports** show the inflow of goods in the territory of Belarus, which adds to the stocks of material resources of the country.

Volume of foreign trade in goods (turnover) is calculated as the sum of values of commodity exports and imports; balance of foreign trade in goods is the difference between the commodity export and import values.

Geographically, exports are distributed by the country of destination, while imports distributed by the country of origin. If the country of origin or dispatch is a member state of the Eurasian Economic Union, imports are recorded by the country of dispatch.

Unit value indices of commodity exports/ imports measure changes in price level of exported/ imported goods in the reference period as compared with the base period.

Volume indices of commodity exports/ imports reflect changes in the volumes of exports/ imports of commodities assuming that the prices of the reference period have not changed compared with the base period.

To calculate unit value indices and volume indices of commodity exports/ imports, the Laspeyres and Paasche formulas are employed, on the basis of which indices are then calculated using the Fisher's formula.

Purchasing power index of exports is calculated as the index of price terms of trade multiplied by the volume index of exports and shows how many times more or less goods can be imported to the amount of export revenues in the current period compared with the base period taking account of the changes in the physical volume of export goods deliveries.
