FOREWORD

The publication presents annual estimates of the System of National Accounts (SNA).

The System of National Accounts of the Republic of Belarus builds on the methodology jointly adopted by the UN, IMF, the World Bank, OECD and Eurostat as the international standard in 2008 (2008 SNA). The SNA provides data about the structure of and developments in the economy using a set of integrated accounts, tables and indicators. The accounts of the System reflect economic transactions between institutional units within each economic activity in terms of the production of goods and services, generation and distribution of income, consumption of goods and services, and capital formation.

The accounts data are compiled for the country as a whole and by sectors. The production account and the generation of income account are broken down by economic activity. The production account data for 2019 – 2024 are shown by economic activity at current and constant prices. The discrepancy between the total gross domestic product (GDP) and the sum of its components, as well as between the GDP components and the sum of their elements at constant prices can be explained by changes in the structure of weights used for the computation of individual links of indices.

The list of economic activities complies with the national classification of the Republic of Belarus OKPE 005-2011 “*Kinds of Economic Activity*” (OKED); institutional units are grouped by economic sectors in accordance with the statistical classification CK 00.007-2015 “*Institutional Units by Sectors of Economy*” (KIES); household expenditures are estimated on the basis the *Classification of Individual Consumption by Purpose (COICOP)*; general government expenditure is compiled according to the *Classification of the Functions of Government (COFOG)*.

The published data are based on official statistical information, administrative data of the Ministry of Finance of the Republic of Belarus on budget execution, of the National Bank of the Republic of Belarus on the balance of payments compiled on the basis of the Balance of Payments Manual (6th edition), other administrative sources and expert estimates. The publication presents the results of the second annual estimates of GDP.

Data on the average annual population were adjusted for the results of the 2019 population census. Indicators for 2019 were calculated using the average annual number of the population adjusted for the results of the 2019 population census.

Relative indicators are calculated using absolute data with a smaller unit of measure than those presented in the tables.

METHODOLOGICAL NOTES

General principles

The economy of a country in general is defined in terms of institutional units. It includes all the institutional units which are resident in the economic territory of a country.

Institutional units are legal and/or natural persons (groups of natural persons) that hold assets, incur liabilities, engage in economic activities and transactions with other legal and/or natural persons on their own behalf, as well as separate subdivisions of legal entities that engage in economic activities and financial transactions and keep accounting records specifying financial result of their activity, and representative offices of foreign organisations.

Residents are institutional units that engage, or intend to engage, in economic activities in the economic territory of the Republic of Belarus over a long period of time (for at least one year).

Resident units engage in transactions with non-resident units (that is, units which are residents of other economies). These transactions are external transactions of the economy and are grouped in the rest of the world account.

Economic territory of a country is the area under administrative control of the government of the given country within which persons, goods and capital can move freely; it does not include territorial enclaves of other countries (embassies, military bases, etc.) or international organizations, but includes its exclaves located in the territory of other countries.

The System of National Accounts (SNA) is a system of interlinked indicators used to describe and analyse macroeconomic processes.

The key indicator of the SNA is the gross domestic product (GDP) which measures the total value of goods and services produced in the economy by all economic activities and intended for final consumption, accumulation and net exports.

GDP can be calculated using three approaches: the production approach, the expenditure approach, and the income approach.

GDP by production approach is calculated as the sum of gross values added (GVA) by economic activity and net taxes on products.

GDP by expenditure approach represents the total final consumption expenditure of households, general government and non-profit institutions serving households (NPISHs), gross capital formation and net exports of goods and services.

GDP by income approach reflects distributive transactions directly related to the production of goods and services (compensation of employees, taxes on production and imports less

subsidies), and gross operating surplus and gross mixed income. Gross operating surplus and gross mixed income are defined as the difference between GDP calculated with the production method, compensation of employees and net taxes on production and imports.

Brief description of accounts

The SNA accounts are constructed on a double-entry basis, i.e. receivables are recorded as resources, while payables are entered as uses. The difference between resources and their uses constitutes the balancing item which is shown on the resources side of the next account.

The goods and services account is the SNA account that records the total supply of goods and services in the economy as well as their uses.

On the resources side, the output of goods and/or services, imports of goods and services, taxes on products less subsidies on products are reflected.

In terms of use, intermediate consumption, final consumption expenditure, gross fixed capital formation, changes in inventories, and exports of goods and services are reflected.

There is no balancing item in this account, i.e. resources here are equal to their uses.

The production account is the SNA account that records transactions directly linked to the production of goods and services.

Under resources, the output of goods and/or services and taxes on products less subsidies on products are recorded.

Under uses, intermediate consumption of goods and services is reflected.

The balancing item is the gross value added.

At the level of the total economy, the balancing item of the production account is GDP which characterizes the final result of production activity of the resident institutional units.

The generation of income account is the SNA account that records distributive transactions which are directly linked to the production of goods and services.

The resources show the gross value added (GDP at the level of the total economy).

The uses reflect the following expenditures of producers: compensation of employees, other taxes on production less other subsidies on production (at the level of the economy as a whole, taxes on production and imports less subsidies on production and imports).

The balancing item here is gross operating surplus and gross mixed income.

The allocation of primary income account is the SNA account that shows how primary income from the production activities and property is distributed between institutional units or sectors of the economy and the rest of the world.

The resources of the account reflect gross operating surplus and gross mixed income, compensation of employees, taxes on production and imports less subsidies on production

and imports, and property income receivable.

The uses consist of the property income payable.

The balancing item here is the balance of primary income.

At the level of the total economy the resources of this account consist of GDP and property income receivable from the rest of the world, while uses reflect only property income payable to the rest of the world. The balancing item here is the balance of primary income of the total economy which is called gross national income.

The secondary distribution of income account is the SNA account that reflects the distribution of income and shows how the balance of primary income of an institutional unit or economic sector transforms into disposable income through current transfers, other than social transfers in kind, receivable and payable.

Resources here show the gross national income and current transfers receivable.

The uses show current transfers payable.

The balancing item here is the gross disposable income.

The redistribution of income in kind account is the SNA account that reflects the redistribution of income and shows how disposable income of households, NPISHs and general government transforms into their adjusted disposable income taking into account social transfers in kind receivable and payable.

The resources show the gross disposable income of the economic sectors and social transfers in kind receivable by the household sector.

The uses show social transfers in kind payable to the household sector.

The balancing item is the gross adjusted disposable income.

The use of gross disposable income account is the SNA account that shows how the sectors of households, of general government and of NPISHs distribute their gross disposable income between final consumption expenditure and gross saving.

The gross disposable income is recorded under resources.

The uses show final consumption expenditure.

The balancing item of the account is gross saving. It represents that part of gross disposable income that is not spent on final consumption of goods and services.

Gross saving may have a positive or a negative value depending on whether disposable income exceeds final consumption expenditure or vice versa.

The use of adjusted disposable income account is the SNA account that shows how gross adjusted disposable income is distributed between actual final consumption and gross saving in household, general government and NPISH sectors.

Gross adjusted disposable income is recorded under resources.

Actual final consumption is recorded under uses.

The balancing item of the account – the gross saving – is identical to the same item in the use of gross disposable income account.

The capital account is the SNA account that reflects the value of non-financial assets acquired or disposed of by resident institutional units as a result of transactions and shows changes in the net capital (acquisition less disposal) through saving and capital transfers.

The main source of financing of capital transactions is gross saving. Another source of funding of these transactions is capital transfers receivable less capital transfers payable.

The balancing item of the account is net lending (+) or net borrowing (-).

The rest of the world account is the SNA account that reflects all transactions between the institutional units of an economy (residents) and institutional units of other economies (non-residents) that took place during a reference period.

The rest of the world account covers the activities of non-resident institutional units in so far as they relate to their interaction with residents. Transactions between residents and non-residents are also reflected in the domestic economy accounts, but there they are not distinguished from the transactions between residents.

The rest of the world account includes the following external accounts:

- the external account of goods and services;
- the external account of primary income and current transfers;
- the external capital account

The feature of the external accounts is that the resources and uses are shown from the perspective of the rest of the world, i.e. of other economies.

Brief explanation of the accounts aggregates

Capital transfers are transactions where an institutional unit transfers gratis assets, in cash or in kind, to another unit, normally for investment purposes. Capital transfers are non-recurrent and considerable in value transactions connected with acquisition or disposal of assets by transaction counterparties. They include taxes on capital, investment subsidies, and other capital transfers.

Changes in inventories is the difference between closing stocks and opening stocks valued at average market prices of the period in question in order to eliminate price effects.

Compensation of employees covers wages and salaries and employers' social insurance contributions. It is recorded as gross amounts, i.e. before taxes and other deductions in compliance with the legislation of the Republic of Belarus, and reflects the compensation of all

employees of resident organizations, regardless of whether these employees are residents or non-residents.

Current transfers include the following major types: taxes on income and profit, on property, and other tax revenue; employers' social insurance contributions; social benefits; and other current transfers.

Exports of goods is the shipment of goods from the territory of the Republic of Belarus that subtract from material stocks of the country.

Exports of services is the provision of various types of services by residents to non-residents.

Final consumption expenditure consists of the final consumption expenditure of households, of general government on individual goods and services and collective services, and also of non-profit institutions serving households.

Final consumption expenditure of non-profit institutions serving households is expenditure incurred by public organizations on consumption goods and services to be provided to households free of charge, including health care, education and cultural services provided by employers to their employees.

General government final consumption expenditure on collective services consists of expenditure incurred by general government on services that are financed from the budget and meet the needs not of individual households, but of the society as a whole or of selected population groups (defence, public administration, roads, etc.).

General government final consumption expenditure on individual goods and services consists of expenditure incurred by general government on consumption goods and services financed from the budget and intended for individual consumption.

Gross disposable income is defined as income left at the disposal of resident units for final consumption and gross saving. It is equal to the sum of gross national income and current transfers receivable less income payable as current transfers.

Gross domestic product is the value of goods and services produced in an economy by all economic activities and intended for final consumption, accumulation and net exports.

Gross fixed capital formation is defined as resident units' investment in fixed capital with the purpose of using it in production to generate new income in future.

Gross national income (GNI) is the total primary income receivable by resident units plus the balance of primary income receivable from the rest of the world. GNI is different from GDP by the value of primary income receivable from the rest of the world less primary income payable to the rest of the world.

Gross operating surplus is the part of gross value added which remains with producers after deducting the outlays related to the compensation of employees and taxpaying.

The surplus generated as a result of production activities of household unincorporated enterprises is referred to as gross mixed income because it includes the component of labour remuneration which is inseparable from the owner's income.

Gross saving is the part of gross disposable income which has not been spent on final consumption of goods and services.

Gross value added (GVA) is the output of goods and/or services less intermediate consumption, calculated by economic activities.

Household actual final consumption is expenditure incurred by households on consumption goods and services as well as household consumption of goods and services in kind: produced for themselves and receivable as labour remuneration and as social transfers from government units and non-profit institutions serving households.

Household final consumption expenditure is expenditure incurred by households on consumption goods and services to meet personal needs. Household final consumption expenditure consists of expenditure on consumption goods and services; goods and services receivable by employees as income in kind (other than social transfers in kind); goods and services produced for own final consumption; expenditure on financial intermediation services indirectly measured.

Imports of goods is the entry of goods into the territory of the Republic of Belarus that add to material stocks of the country.

Imports of services is receiving various types of services by residents from non-residents.

Intermediate consumption is the value of goods and services consumed in the process of production over the reference period.

Kind of economic activity is a process where material resources, equipment, labour, and technology are combined in such a way that this results in the production of a homogeneous set of products (goods or services).

Labour productivity is a measure of effectiveness of production which characterizes the output or the gross value added per unit of labour. For the total economy, it is calculated as a ratio of GDP (GVA) to the number of employed in the economy. To study the dynamics, the labour productivity index is calculated as a ratio of the volume index of GDP (GVA) to the index of employed population.

Net exports of goods and services is the difference between exports and imports of goods and services.

Net lending (+) or net borrowing (-) is the difference between the changes in net capital

as a result of saving and capital transfers, and net acquisition of non-financial assets (acquisition of non-financial assets less disposal and consumption of fixed capital). A negative value represents net borrowing. Net lending or net borrowing shows the value of resources that can be lent or need to be borrowed. At the level of the economy, this item shows the value of resources payable by the domestic economy to the rest of the world or receivable by the domestic economy from the rest of the world.

Net taxes on products are taxes on products less subsidies on products.

Non-observed economy is a part of the national economy which includes the production, circulation and use of goods and services not covered (or not fully covered) by state statistical surveys, including illegal economic activities.

Other taxes on production are taxes related to the use of factors of production (land, assets, labour force), as well as state duties for issuing permits, fees for carrying out certain economic activities and other mandatory payments required to carry out the economic activity of a resident.

Other subsidies on production are subsidies, except for subsidies on products, provided to institutional units as a result of their participation in production.

Output of goods and/or services is the total value of goods and/or services which are the result of economic activities of residents in a reference period.

Production sector consists of the following economic activities: agriculture, forestry and fishing; mining and quarrying; manufacturing; electricity, gas, steam, hot water and air conditioning supply; water supply; waste management and remediation activities; and construction.

Property income is primary income receivable by institutional units from the lending of financial assets and/or non-produced non-financial assets (natural resources) to other institutional units for use in production.

Service sector consists of wholesale and retail trade; repair of motor vehicles and motorcycles; transportation, storage, postal and courier activities; accommodation and food service activities; information and communications; financial and insurance activities; real estate activities; professional, scientific and technical activities; administrative and support service activities; public administration; education, health and social work activities; arts, sports, entertainment and recreation; and other service activities.

Statistical discrepancy - the difference between GDP values calculated by the production approach and the income approach.

Subsidies are current unrequited payments from the budget to organizations provided these organizations produce particular goods or services.

Subsidies on products are subsidies given for a unit of a good produced or service provided, that is, proportionally to the quantity or value of goods and services produced and sold or imported by resident units.

Taxes on products are taxes payable proportionally to the quantity or value of goods and services produced and sold or imported by resident units. Taxes on products include the value added tax (VAT), excise taxes, customs charges, import customs duties and export customs duties.

Transfer is a transaction in which one institutional unit provides a good, a service or an asset to another institutional unit without receiving from the latter any good, service or asset in return as indemnity. Distinction is made between current and capital transfers. They may be either in cash or in kind.

Institutional sectors

An institutional sector is a grouping of institutional units that are homogeneous in terms of their functions in the economy and sources of financing, which implies their similar economic behaviour.

The non-financial corporations sector is composed of institutional units whose main function is the production of market goods and provision of non-financial services to be sold on the market and generate profit.

The resources of these units are primarily obtained from sales of goods and services, but some expenses can be subsidized from the budget.

The financial corporations sector consists of institutional units that engage in financial intermediation and provide other auxiliary financial services to other institutional units on a commercial basis.

Their resources are obtained from the liabilities incurred and interest, insurance premiums and commission fees received.

The general government sector consists of institutional units which provide primarily non-market services (or produce goods) for individual or collective consumption and redistribute income.

Resources of these units are obtained from taxes and contributions payable by institutional units of other sectors as well as from property income.

The household sector consists of all natural persons in an economy, whose main functions are the supply of labour force and final consumption, as well as the production of goods and services for sale and personal use. The institutional unit in the household sector may consist of one or several individuals.

The non-profit institutions serving households sector consists of institutional units that are not market producers of goods and services, provide goods and services to households or society at large for free or at economically insignificant prices (public associations, creative and professional unions, religious organisations, charitable foundations; non-market separate divisions of organisations that provide health, education, cultural services (polyclinics, clubs, stadiums and the like)).

The main source of funds of these units is membership fees and organizations' funds.

Valuation principles

Economic transactions in the SNA are recorded on an accrual basis at current market prices.

Market price is the end-buyer price paid by purchaser for the delivery of a unit of a good or service. It includes any trade and transport costs and taxes on products (except deductible value-added tax) less subsidies on products.

In order to eliminate the effects of various tax and subsidy rates on the structure of production and generation of income, the GVA by economic activities is estimated at basic prices.

Basic price is the price receivable by producer for a unit of a good or service less any taxes on products, and plus subsidies on products.

In the SNA methodology, the intermediate consumption and changes in inventories are valued net of holding gain (loss) receivable by asset owner as a result of price changes due to inflation. Under the conditions of inflation holding gain (loss) can be rather substantial.

Evaluation of GDP and its components at constant prices is based on a revaluation of the corresponding figures at previous year's prices. Revaluation of components of produced GDP in constant prices is made with a double deflation method where the GVA at constant prices is derived as the difference between the value of the output of goods and/or services and the value of the intermediate consumption calculated at constant prices.

Revaluation of the output and intermediate consumption in constant prices is made with two methods:

- deflating data for the accounting period at current prices for a specific economic activity with corresponding price indices;
- extrapolating data for the base year at current prices for a specific economic activity with volume indices or physical indicators that reflect the trends in the relevant economic activity.

The physical volume index is a relative statistical indicator of dynamics, expressed as a percentage, characterizing the change in the value of a statistical indicator over time, provided that prices in the reporting period did not change compared to the base period (year).

The GDP deflator is the price index of all final goods and services the value of which is included in the GDP of the economy. It is a ratio of the nominal GDP at market prices of the current year to the real GDP at prices of the base year.

International comparisons of gross domestic product

The International Comparison Program (ICP) of gross domestic product provides comparable prices and quantitative measures across different countries by components of GDP use.

The Republic of Belarus takes part in the International Comparison Program on a regular basis since 1993 (ICP rounds of 1993, 1996, 2000, 2005, 2008, 2011, 2014, 2017, 2021 and 2024).

The international comparisons of GDP require that the following three conditions are met:

- the economic substance of GDP must be unified for the countries;
- GDP must be expressed in the same currency;
- prices of goods and services must be comparable.

The national GDP estimates of the countries participating in the international comparisons meet the first requirement. However, these estimates do not meet the second and/or the third requirement because they are expressed in national currencies and are calculated on the basis of national prices. These two latter requirements are met by using purchasing power parities (PPPs).

The purchasing power parity represents a number of currency units needed to buy a standard set of goods and services which can be purchased for one currency unit of the reference country (or for one unit of currency common to a group of countries). PPPs are used for recalculation of value indicators expressed in national currency, such as household final consumption expenditure, main GDP components or GDP on the whole into a single currency.

As the comparison results can be normally obtained not earlier than three years after the ICP round, in compliance with the international practice the interim PPPs of the national currency at the level of GDP in the years between rounds are computed using extrapolation method. Herewith, the PPPs of the base ICP year remain the same. The time series of GDP at purchasing power parity are updated continuously to take account of the latest changes in data and are also revised when the results of the next ICP round are released, which complies with the international practice.

2. Accounts by economic activity**2.1. Production account in 2019**

(at current prices; BYN million)

	Resources	Uses	
	Output at basic prices	Intermediate consumption	Gross value added
Production sector	158 409.9	106 495.2	51 914.7
of which:			
Agriculture, forestry and fishing	23 127.5	13 972.9	9 154.6
Industry	117 015.5	81 999.8	35 015.7
of which:			
Mining and quarrying	1 492.1	567.3	924.8
Manufacturing	103 941.5	74 785.6	29 155.9
Electricity, gas, steam, hot water and air conditioning supply	9 635.3	5 617.5	4 017.8
Water supply; waste management and remediation activities	1 946.6	1 029.4	917.2
Construction	18 266.9	10 522.5	7 744.4
Services sector	100 970.4	35 724.1	65 246.3
of which:			
Wholesale and retail trade; repair of motor vehicles and motorcycles	22 810.9	10 298.5	12 512.4
Transportation, storage, postal and courier activities	13 997.2	6 355.8	7 641.4
Accommodation and food service activities	2 796.9	1 551.0	1 245.9
Information and communication	11 165.0	2 696.6	8 468.4
Financial and insurance activities	5 927.3	1 720.6	4 206.7
Real estate activities	9 786.1	2 762.7	7 023.4
Professional, scientific and technical activities	5 450.2	1 609.4	3 840.8
Administrative and support service activities	3 056.4	1 000.0	2 056.4
Public administration	6 635.2	1 782.5	4 852.7
Education	7 432.1	1 679.1	5 753.0
Human health and social work activities	7 785.2	2 775.7	5 009.5
Arts, sports, entertainment and recreation	2 177.0	766.0	1 411.0
Other service activities	1 950.9	726.2	1 224.7
Total economic activities	259 380.3	142 219.3	117 161.0
Taxes on products	x	x	20 197.7
Subsidies on products (-)	x	x	2 626.6
Gross domestic product	x	x	134 732.1

2.2. Production account in 2020

(at current prices; BYN million)

	Resources	Uses	
	Output at basic prices	Intermediate consumption	Gross value added
Production sector	166 117.5	108 581.6	57 535.9
of which:			
Agriculture, forestry and fishing	25 759.4	15 163.3	10 596.1
Industry	120 344.1	82 149.5	38 194.6
of which:			
Mining and quarrying	1 357.9	563.8	794.1
Manufacturing	106 567.4	74 397.2	32 170.2
Electricity, gas, steam, hot water and air conditioning supply	10 382.2	6 127.7	4 254.5
Water supply; waste management and remediation activities	2 036.6	1 060.8	975.8
Construction	20 014.0	11 268.8	8 745.2
Services sector	111 490.3	38 109.3	73 381.0
of which:			
Wholesale and retail trade; repair of motor vehicles and motorcycles	26 429.5	12 131.1	14 298.4
