## EDITORIAL BOARD:

Vladimir Zinovsky – Chair

Irina Kostevich, Vadim Bogush, Irina Kangro, Elena Kukharevich,  
Elena Palkovskaya, Olga Klavsut, Irina Sergeichenko

The statistical book presents indicators of the system of national accounts and estimates of the gross regional product of the Republic of Belarus.

The publication is intended for senior management, government agencies, financial and economic departments of enterprises, scientific organisations, banks, higher education teaching staff, postgraduates and students of economics, and other interested users.

The book includes also data sourced from the UNECE database and the official websites of the Federal State Statistics Service of Russia (Rosstat) and CIS Interstate Statistical Committee (CISSTAT).

ISBN 978-985-7015-56-6

## FOREWORD

The publication presents results of the annual and quarterly estimates of the System of National Accounts (SNA).

The System of National Accounts of the Republic of Belarus is based on the methodology jointly accepted by the UN, IMF, the World Bank, OECD and Eurostat in 1993 as the international standard (SNA 93). The SNA provides data about the structural conditions and developments in the economy using a set of integrated accounts, tables and indicators. The accounts of the System reflect economic transactions taking place between institutional units within each kind of economic activity, i.e. production of goods and services, generation and distribution of income, consumption of goods and services, and capital formation.

The accounts data are compiled for the country as a whole and by sectors. The production and generation of income accounts are broken down by economic activities. The production account data for 2009 - 2012 are shown in a detailed distribution by economic activities at current and constant prices. The discrepancy between the total gross domestic product (GDP) and the sum of its components, as well as between the GDP components and the sum of its elements calculated at constant prices can be explained by the changes in the structure of weights used for the computation of individual links of indices.

The list of economic activities complies with the nationwide classification of the Republic of Belarus OKPB 005-2006 "Kinds of Economic Activity"; household expenditures are estimated on the basis the Classification of Individual Consumption by Purpose (COICOP); and general government expenditures are compiled according to the Classification of the Functions of Government (COFOG).

According to the national accounts data, the GDP of Belarus at current prices amounted to BYR 530.4 trillion in 2012, showing an increase of 1.7% at constant prices as compared with 2011. The growth was due to the increase in the value added in the main kinds of economic activity – by 5.5% in industry; 6.5% in agriculture, hunting and forestry; 6.5% in transport and communications. However, the GDP growth rate was negatively affected by downward trends in construction (-9.9%) and in trade, repair of motor vehicles and household and personal goods (-5.1%).

In 2012 GDP per capita amounted to BYR 56,036 thousand, showing an increase of 1.8% at constant prices compared with 2011.

In 2012 the shares of production sector and services sector in GDP accounted were 46.1% and 43.6% respectively. The share of net taxes on products grew by 0.5% and made up 12.7%.

In the sectoral structure of gross value added in 2012 the largest share is steadily assigned to the sector of non-financial institutions (75.6%). The share of the general government sector remains stable in recent years (10-13%).

A greater part of the country's GDP is used for consumption. Household final consumption is the major category of the system of national accounts reflecting the reproduction processes of the vital activity of population. The share of GDP falling to this type of consumption in 2012 was 45.8%. In real terms, final consumption expenditure of households grew by 10.8% in 2012 as compared with 2011. The share of general government expenditure on individual goods and services has been about 10% in recent years, which reflects the specific features of the socio-economic policy pursued by the state and characterizes budgetary outlays for public health, social security, education, science, culture, housing and utilities. The share of gross capital formation in 2012 made up 35.1% of GDP and still remains significant. The balance of exports and imports of goods and services in 2012 was positive at BYR 24.5 trillion (4.6% of GDP), which had a beneficial effect on GDP.

The quarterly data are presented in the book at current prices and average annual prices of 2009.

For the analysis of the quarterly GDP data, adjustments are made to eliminate the impact of seasonality on the GDP dynamics. Seasonal adjustments allow for the exclusion of the sub-annual seasonal effects resulting from natural factors, administrative and legislative measures, social and cultural traditions as well as from other systemic impacts (number of working days within the specified period of time, or events which take place in regular time intervals, but each year in different time). GDP is seasonally adjusted using Demetra+ software. Data for 2005-2008 at average annual prices of 2009 have been re-calculated backwards with the chain method using the volume indices of GDP at average annual prices of 2005.

The first three quarters of 2012 reflect the GDP growth in comparison with the corresponding quarters of the previous year (the increment was 3.3% in Quarter 1, 2.7% in Quarter 2, and 1.6% in Quarter 3); a minor recession (0.5%) was observed in Quarter 4.

The quarterly pattern of GDP use in 2012 shows that household final consumption expenditure accounted for the major part of expenditure (43.5% in Quarter 1, 41.2% in Quarter 2, 49.6% in Quarter 3, and 47.8% in Quarter 4). The share of gross fixed capital formation in GDP in 2012 grew from 25.2% in Quarter 1 to 40.5% in Quarter 4 as a result of the positive balance of exports and imports of goods and services in the first three quarters and a negative balance in Quarter 4.

The publication provides annual estimates of gross regional product (GRP) of the Republic of Belarus.

In 2012 the biggest contribution in GDP was made by Minsk city (24.4%), Minsk region (14.5%) and Gomel region (11.3%).

The published data are based on statistical surveys of organisations, information from the report on the budget execution (income and expenditure), data of the Balance of Payments of the National Bank of the Republic of Belarus compiled on the basis of the 6<sup>th</sup>

edition of the Balance of Payments Manual, data of household sample survey, other administrative sources and expert estimates. According to the Statistical Work Programme of the National Statistical Committee of the Republic of Belarus the publication presents the results of the third quarterly and second annual GDP estimates and of the second annual GRP estimates.

Explanation of symbols:

- - not applicable
- ... - data not available
- 0,0 - negligible magnitude
- x - filing is not possible or expedient

Ratios are calculated on the basis of absolute figures with a smaller unit of measurement than those presented in the tables.

METHODOLOGICAL PROVISIONS

General concepts

The economy of a country is defined in terms of institutional units. It consists of all the institutional units which are resident in the economic territory of a country.

**Residents** are institutional units carrying out or intending to carry out their activities in the economic territory of the Republic of Belarus on a long-term basis.

Resident units engage in transactions with non-resident units (that is, units which are residents of other economies). These transactions are the external transactions of the economy and are grouped in the account of the rest of the world.

**The economic territory of the country** is the territory which is administratively governed by the government of the given country and within which persons, goods and capital can move freely; it does not include the territorial enclaves of other countries (embassies, military bases, etc.) or international organisations but includes the enclaves of the given country in the territory of other countries.

**The System of National Accounts (SNA)** is a system of interrelated indicators used to describe and analyze macroeconomic processes.

The key indicator of the SNA is the **Gross Domestic Product (GDP)**, which characterizes the value of goods and services produced in the country by all economic activities and intended for final consumption, capital formation and net exports.

GDP can be calculated in three ways: from the production side, from the use side, and through sources of incomes.

**GDP from the production side** is calculated as the sum of values added of economic activities and net taxes on products.

**GDP through sources of income** reflects primary income receivable by the units directly participating in production as well as by general government and non-profit institutions serving households (NPISHs). Here, gross operating surplus and gross mixed income are a balancing item and are defined as the difference between GDP calculated with production method, compensation of employees and net taxes on production and imports.

**GDP from the use side** represents the total final consumption expenditure of households, general government and non-profit institutions serving households, gross capital formation and net exports of goods and services (less imports).

The SNA accounts are constructed on a double-entry basis, i.e. receivables are recorded as resources, while payables are entered as uses. The difference between resources and their uses constitute the balancing item which is shown on the resources side of the following account.

### Brief description of accounts

**The goods and services account** records the total resources of goods and services in the economy as a whole, as well as how these resources are used.

On the resources side, the output of goods and services, imports of goods and services, taxes on products less subsidies are reflected.

Uses consist of intermediate consumption, final consumption expenditure, gross fixed capital formation, changes in inventories and exports of goods and services.

There is no balancing item in this account, i.e. resources are equal to uses.

**The production account** records transactions directly linked to the production process.

Under resources, the output of goods and services and taxes on products less subsidies are recorded.

Under uses, intermediate consumption of goods and services is reflected. This account defines gross value added which is equal to the difference between the output and intermediate consumption.

At the level of the total economy the balancing item of production account is **gross domestic product** (GDP) characterizing the final result of production activity of the resident institutional units.

**The generation of income account** records distributive transactions which are directly linked to the process of production.

The resources show gross domestic product.

The uses reflect primary incomes paid out by resident institutional units directly engaged in the production of goods and services (compensation of employees, taxes on production and on imports less subsidies).

The balancing item here is gross operating surplus. For the entities established by households where household members can make unpaid labour

inputs, the balancing item contains a labour remuneration component which cannot be separated from the owner's income. In such instances the balancing item is called gross mixed income.

**The primary distribution of income account** shows how incomes obtained from the production activities or property are distributed among residents (institutional units or sectors of economy). It is not directly linked to the process of production.

The resources consist of gross operating surplus and gross mixed income, compensation of employees, taxes on production and imports less subsidies on production and imports, and property incomes receivable.

The uses consist of the property incomes payable.

The balancing item here is **the balance of primary incomes**.

At the level of the total economy the resources of this account consist of GDP and property incomes receivable from the rest of the world, while uses reflect only property incomes payable to the rest of the world. The balancing item here is the balance of primary incomes for the economy as a whole which is called **gross national income (GNI)**.

**The secondary distribution of income account** shows the formation of gross disposable income as a result of receiving and paying out of current transfers.

At the level of the total economy resources show gross national income and current transfers receivable from the rest of the world.

The uses show the transfers payable to the rest of the world.

The balancing item here is the **gross disposable income** intended for final consumption and capital formation.

**The redistribution of income in kind account** reflects the process of redistribution of social transfers in kind provided to households by NPISHs and general government sector.

Gross disposable income is carried forward from the secondary distribution of income account and recorded under resources.

The value of social transfers in kind equals to the sum of final consumption expenditures of general government providing individual services and of NPISHs.

**The use of gross disposable income account** shows how households, general government and NPISHs distribute their gross disposable income between final consumption expenditures and gross saving.

Gross disposable income is carried forward from the secondary distribution of income account and recorded in resources.

The uses show final consumption expenditure.

The balancing item of the account is **gross saving**. It represents that part of gross disposable income which is not spent on final consumption of goods and services.

Gross saving may have a positive or a negative value depending on whether disposable income exceeds final consumption expenditure or vice versa.

**The use of adjusted disposable income account** shows how adjusted gross disposable income is distributed between actual final consumption and gross saving in household, general government and NPISH sectors.

Adjusted gross disposable income is brought forward from the redistribution of income in kind account and recorded under resources.

Actual final consumption is recorded under uses.

The balancing item of the account is **gross saving**. It has the same value as in the use of gross disposable income account.

**The capital account** reflects the value of non-financial assets acquired by resident institutional units (or disposed of) as a result of transactions and shows changes in the net capital (acquisition less disposal) through saving and capital transfers.

The main source of financing of capital transactions is gross saving, which is brought forward from the use of gross disposable income account. Other sources of funding these transactions are capital transfers receivable less payable.

The balancing item of the account is **net lending (+) or net borrowing (-)**.

**The rest of the world account** reflects all transactions between institutional units of a given country (residents) and institutional units of other countries (non-residents) that took place during a reference period.

The rest of the world account covers activities of non-residents as related to their interaction with residents. Transactions between residents and non-residents are also reflected in the domestic economy accounts, but there they are not separated from the transactions between residents.

The rest of the world account includes the following external accounts:

- the external account of goods and services;
- the external account of primary incomes and current transfers;
- the external capital account

The feature of the external accounts is that the resources and uses are shown from the point of view of the rest of the world, i.e. of other economies.

## Brief explanation of the accounts aggregates

**Gross Domestic Product** characterizes the value of goods and services produced in an economy by all economic activities and intended for final consumption, capital formation and net exports.

**Output of goods and services** is the total value of goods and services which are the result of economic activities of residents in a reference period.

**Production sector** consists of the following kinds of economic activity: agriculture, hunting and forestry; fishing and fish-farming; mining and quarrying; manufacturing; production and distribution of electricity, gas and water; and construction.

**Services sector** includes trade, transport and communications, financial activities, education, health and social work activities, etc.

**Intermediate consumption** is equal to the value of goods and services consumed in the process of production in the reference period. The intermediate consumption does not include consumption of fixed capital.

At the level of the total economy, intermediate consumption also comprises, as a separate item, the consumption of financial intermediation services indirectly measured.

**Gross value added** is calculated at the level of economic activities as the value of goods and services produced in the reference period (output) less the value of goods and services fully consumed in the process of production in the same period (intermediate consumption). "Gross" means that the value added includes the value of fixed capital consumed in the process of production.

**Gross regional product (GRP)** is a regional analogue of the gross domestic product indicator of the Republic of Belarus calculated with production method.

Methodological principles for the calculation of GRP and its components are similar to those used at the national level.

Total GRP calculated for all regions of the Republic of Belarus differs from GDP by the share undistributed by regions (further referred to as unallocated share).

**Unallocated share** represents gross value added of non-market services provided by general government sector to the society as a whole (defence and public administration) and other non-market services financed out of the republican budget;

non-observed economy; taxes on products paid to the republican budget and subsidies on products paid out from the republican budget of Belarus.

**Non-observed economy** refers to the total hidden, informal and illegal economic activities that cannot be observed using direct statistical methods.

**Kind of economic activity** is a process where material resources, equipment, labour, and technology are combined in such a way that this results in the production of a homogenous set of products (goods or services).

**Financial intermediation services indirectly measured (FISIM)** is accumulation of temporarily spare funds of institutional units by banks and other non-bank credit and financial institutions and lending them to other institutional units.

**Taxes on products** are taxes payable proportionally to the quantity or value of goods and services produced and sold or imported by resident units. Taxes on products include value added tax (VAT), excise taxes, customs charges, import customs duties, etc.

“Net” means that taxes are shown excluding related subsidies.

**Labour productivity** is a measure of effectiveness of production which characterizes the output of products or gross value added per unit of resources and factors of production used, and represents a ratio between the volume of production and labour input.

**Subsidies** are current unrequited payments from the budget to organizations provided these organisations produce particular goods or services.

**Subsidies on products** are subsidies given for a unit of a good produced or service provided, that is proportionally to the quantity or value of produced and sold goods and provided services or those imported by residents.

**Compensation of employees** is defined as the total remuneration, in cash or in kind, payable by employers to employees in return for work done during the accounting period. Compensation of employees is recorded on the basis of accrued amounts, i.e. before taxes and other deductions in accordance with the legislation of the Republic of Belarus.

**Other taxes on production** consist of taxes related to the use of production factors (land, assets, and labour force) as well as of the state duty for granting a special permission (license) to carry out selected activities, or other compulsory payments required for the resident to carry out activities.

**Gross operating surplus** is the part of gross value added which remains with producers after deducting the outlays related to the compensation of employees and

taxes on production and imports.

Surplus generated as a result of production activities of organizations established by households is referred to as **gross mixed income** because it includes the component of labour remuneration which is inseparable from the owner's income.

**Property incomes** include incomes receivable by institutional units from putting the financial assets, land, and other non-financial non-produced assets (minerals and other natural resources, patents, licenses, etc.) at the disposal of other institutional units.

**Gross national income (GNP)** is the sum of primary incomes receivable by resident institutional units plus the balance of primary incomes receivable from the rest of the world. Difference between GNP and GDP is equal to the difference between the total primary incomes receivable by residents from non-residents and the total primary incomes payable by residents to non-residents

**Transfer** is defined as a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart. There are current and capital transfers. They may be either in cash or in kind.

**Capital transfers** are transactions where an institutional unit transfers gratis assets, in cash or in kind, to another unit, as a rule for investment purposes. Capital transfers are usually nonrecurrent and considerable in value transactions connected with assets acquisition or disposal by transaction participants. They include taxes on capital, investment subsidies, and other capital transfers.

**Current transfers** include the following major types: taxes on income, profit, property and the like; state social insurance contributions, social benefits, etc.

**Gross disposable income** is defined as income left at the disposal of resident institutional units for final consumption and gross saving. It is equal to the gross national income less income payable as current transfers plus current transfers receivable.

**Final consumption expenditures** consist of household final consumption expenditure, general government final consumption expenditure on individual goods and services and collective services, and also final consumption expenditure of non-profit institutions serving household. Such grouping shows which sector pays for final consumption.

**Household final consumption expenditure** consists of expenditure incurred by households on consumption goods and services to meet personal needs.

Household final consumption expenditure consists of purchases of (consumption) goods and services, expenditure on final consumption of goods from incomes received in kind (except social transfers in kind), and consumption expenditure of home-produced goods and services for own final consumption.

**General government final consumption expenditure on individual goods and services** consists of expenditure incurred by general government on consumption goods and services intended for individual consumption. Such expenditures are funded from the budget.

**General government final consumption expenditure on collective services.** This indicator differs from the previous one in that it includes services provided out of budgetary funds and aimed to meet the needs not of individual households, but of the community as a whole or of selected population groups (defence, administration, roads, science).

**Final consumption expenditure of non-profit institutions serving households** is expenditure incurred by public organizations on consumption goods and services to be provided to households free of charge, including health and education services provided by organizations to their employees.

**Gross saving** is the part of gross disposable income which has not been spent on final consumption of goods and services.

**Gross fixed capital formation** is defined as resident units' investment in fixed capital with the purpose of using it in production to generate new incomes in future.

**Changes in inventories** comprise changes in productive stocks, work-in-progress costs, semi-finished and finished products, goods for sale and state material reserves. The changes in the value of inventories in a specified period is equal to the difference between the value of inventories at the end and at the beginning of the period, valued at average market prices of the period in question in order to eliminate price effects.

**Net lending (+) or net borrowing (-)** is defined as the excess or deficit of the sources of funds over the expenditures on net acquisition of non-financial assets. At the level of the total economy, net lending or net borrowing show the value of resources payable to the rest of the world or receiveable from the rest of the world.

**Net exports** of goods and services are defined as the difference between exports and imports of goods and services in value terms and include the turnover of the trade of Belarus with foreign countries, including the CIS countries.

## Sectors of the economy

**Sector** is a grouping of institutional units (i.e. economic entities that, in their own right, own goods and assets, incur liabilities and engage in economic activities and in transactions with other institutional units) which are homogeneous in terms of their functions in the economy, and sources of funding, which implies their similar economic behaviour.

Institutional units are grouped into the following sectors: the non-financial organisations, the financial organisations, the general government, the households, and the non-profit institutions serving households. To record their interrelations with other countries, the “rest of the world” sector is formed, integrating all non-resident institutional units in terms of their interaction with residents.

**The non-financial organisations sector** is composed of institutional units whose main function is the production of market goods or non-financial services to be sold on the market and generate profits. The resources of these units are primarily obtained from sales of goods and services, but some expenses can be subsidized from the budget.

**The financial enterprises sector** consists of institutional units engaged in financial intermediation or in auxiliary financial activities on a commercial basis. Their resources are obtained from the liabilities incurred and interest received, insurance premiums and commission fees.

**The general government sector** consists of institutional units which, in addition to their political functions and economic regulation, provide primarily non-market services (and possibly produce goods) for individual or collective consumption in public health, social security, education, culture and art, and recreation, and collective services in public administration, order and safety, defence, science and science services, road maintenance, agriculture services, and redistribute incomes. Resources of these units are obtained from taxes and contributions paid by units of other sectors as well as from property incomes.

**The household sector** consists of all natural persons in the economy, whose main function is the supply of labour force and final consumption, as well as production of goods and services for sale and personal use. The institutional unit in the household sector may consist of one or several individuals.

**The non-profit institutions serving households sector** comprises institutional units providing non-market services to households (public associations,

artistic and trade unions, religious organizations, charitable foundations; structural units of organizations providing services in public health, education and culture (departmental hospitals, clubs, stadiums and the like)), whose main source of funds are membership fees and organisations' funds.

### Principles of valuation

Economic transactions in the SNA are recorded on an accrual basis at prices as of the time these transactions occur (at current prices).

**Market price** is a final purchaser's price. It includes trade and transport margins and taxes on products less subsidies on products.

In order to eliminate the effects of various tax rates and subsidies on the structure of production and generation of income, indicators of value added by economic activities are valued at basic prices.

**Basic price** is the price receivable by the producer for a unit of a good or service less any taxes on products, and plus subsidies on products (except subsidies on imports).

In the SNA estimates, output, intermediate consumption, operating surplus and changes in inventories are calculated excluding **holding gains (losses)**, which are defined as the value of products generated due to products price changes during the period when the products were held in stocks. Under the conditions of inflation holding gains (losses) can be rather substantial.

**Revaluation at constant prices** is made both for GDP produced and for it uses. Prices of the previous and the base years are used as constant prices. Revaluation of GDP production aggregates at constant prices of the previous year is made with a double deflation method where the gross value added at constant prices is derived as the difference between the output and intermediate consumption valued at constant prices.

Revaluation of output and intermediate consumption at constant prices is made with two methods:

- deflation of data at current prices for the accounting period with corresponding price indices.
- extrapolation of data at current prices for the base year with volume indices or physical indicators adequately reflecting trends in a specific kind of economic activity.

**Base year** is a year used to define price pattern, on the basis of which statistical indicators at **average annual prices** are calculated. Different base years result in different estimates of statistical indicators at average annual prices. To define a base year, two methods are employed:

- chain-linking method, where the GDP data for the reference year are expressed at the prices of the base year, with the previous year taken as the base. As a result of such procedure, volume indices by quarters within two adjacent years are obtained, which are then used to construct chain indices, which allows to estimate data at prices of any base year (different from the previous year) for a number of years;
- fixed base year method, where the data for a number of years are valued at prices of a fixed base year which is changed once every five years.

**GDP deflator index** is a ratio between GDP at current prices to GDP at constant prices of the previous (corresponding) period. Unlike the prices index of goods and services, the GDP deflator measures changes in compensation of employees, operating surplus (including mixed income), and consumption of fixed assets resulting from price changes and nominal net taxes.

**Statistical discrepancy** between gross domestic product produced and gross domestic product consumed shows the discrepancy between GDP values calculated with different methods: as a sum of values added and as a sum of final consumption, gross capital formation and net exports.

### International comparisons of gross domestic product

The International Comparison Programme (ICP) of gross domestic product provides comparable prices and quantitative measures in different countries by components of GDP use.

The Republic of Belarus takes a regular part in the International Comparison Programme from 1993 (ICP rounds of 1993, 1996, 2000, 2005, 2008 and 2011).

International GDP comparisons should meet the following three conditions:

- the economic substance of GDP must be unified for the countries;
- GDP must be expressed in the same currency;
- prices of goods and services must be comparable.

The national GDP estimates of the countries participating in international comparisons meet the first requirement. However, these estimates do not meet the

second and/ or the third requirement because they are expressed in national currencies and are calculated on the basis of national prices. These two requirements are met by using purchasing power parities (PPPs).

**Purchasing power parity** represents a number of currency units needed to buy a standard set of goods and services which can be purchased for one currency unit of the basic country (or one unit of currency common to a group of countries). PPP is used for the recalculation of value indicators in national currency, such as household final consumption expenditure, main GDP components and GDP into a single currency.

The main indicators calculated within the framework of international comparisons by using PPP are as follows:

- **volume indices of GDP** and primary groups or main components – a ratio of GDP (or group) of the country under comparison to GDP (or group) of the basic country (group of countries). At the level of GDP these indices are used for the comparison of the national economy scales of countries;
- **volume indices of GDP per capita** – a ratio of GDP per capita of the country under comparison to GDP of the basic country. This essential indicator is often used for the comparison of economic well-being of the population. It can also be calculated both at the level of GDP and at the level of primary groups;
- **comparative price level** – a ratio of PPP to currency exchange rate. The comparative price level shows how much, on average, prices of goods and services in one country are higher or lower than the prices in another country if converted into the currency of that country. Higher comparable price levels usually correspond to higher GDP values per capita. The difference between PPP and currency exchange rate is used as the main criterion for defining “cheaper” or “more expensive” countries as compared with another country.

As the comparison results can be usually obtained not earlier than two years after the ICP round, in compliance with the international practice the interim PPP estimates of the national currency in the years between rounds are computed using the **global extrapolation method**.
