

NATIONAL STATISTICAL COMMITTEE OF THE REPUBLIC OF BELARUS

NATIONAL ACCOUNTS OF THE REPUBLIC OF BELARUS

Statistical Book

MINSK

2016

EDITORIAL BOARD:

Inna Medvedeva – Chair

Irina Kangro, Zhanna Vasilevskaya, Elena Kukharevich,
Olga Dovnar, Elena Palkovskaya, Andrey Borichevski, Irina Sergeichenko

The statistical book presents indicators of the system of national accounts and estimates of the gross regional product of the Republic of Belarus.

The publication is intended for senior management, government agencies, financial and economic departments of enterprises, scientific organisations, banks, higher education teaching staff, postgraduates and students of economics, and other interested users.

The book includes also data sourced from the UNECE and IMF databases and the official websites CIS Interstate Statistical Committee (CISSTAT).

ISBN 978-985-7015-96-2

FOREWORD

The publication presents the annual estimates of the System of National Accounts (SNA).

The System of National Accounts of the Republic of Belarus is based on the methodology jointly accepted by the UN, IMF, the World Bank, OECD and Eurostat as the international standard in 1993 (SNA 93). The SNA provides data about the structural state and developments in the economy using a set of integrated accounts, tables and indicators. The accounts of the System reflect economic transactions between institutional units in terms of the production of goods and services, generation and distribution of income, consumption of goods and services, and capital formation within each economic activity.

The accounts data are compiled for the country as a whole and by sectors. The production and generation of income accounts are broken down by economic activities. The production account data for 2011 - 2014 are shown in a detailed distribution by economic activity at current and constant prices. The discrepancy between the total gross domestic product (GDP) and the sum of its components, as well as between the GDP components and the sum of their elements calculated at constant prices can be explained by changes in the structure of weights used for the computation of individual links of indices.

The list of economic activities complies with the nationwide classification of the Republic of Belarus OKRB 005-2006 "*Kinds of Economic Activity*"; household expenditures are estimated on the basis the *Classification of Individual Consumption by Purpose (COICOP)*; general government expenditure is compiled according to the *Classification of the Functions of Government (COFOG)*.

The publication provides annual estimates of gross regional product (GRP) of the Republic of Belarus.

The published data are based on statistical surveys of organisations, information from the report on the budget execution (income and expenditure), data of the Balance of Payments of the National Bank of the Republic of Belarus compiled on the basis of the 6th edition of the Balance of Payments Manual, data of household sample survey, other administrative sources and expert estimates. According to the Statistical Work Programme of the National Statistical Committee of the Republic of Belarus, the publication presents the results of the second annual GDP and GRP estimates.

Explanation of symbols:

- - not applicable
- ... - data not available
- 0.0 - negligible magnitude
- x - table layout makes entry impossible or meaningless

Relative indicators are calculated on the basis of absolute figures with a smaller unit of measure than those presented in the tables.

In certain cases insignificant discrepancy between the total and the sum of its components is explained by data rounding.

METHODOLOGICAL PROVISIONS

General principles

The economy of a country is defined in terms of institutional units. It consists of all the institutional units which are resident in the economic territory of a country.

Residents are institutional units carrying out or intending to carry out their activities in the economic territory of the Republic of Belarus on a long-term basis (for not less than a year).

Resident units engage in transactions with non-resident units (that is, units which are residents of other economies). These transactions are the external transactions of the economy and are grouped in the rest of the world account.

Economic territory of a country is the territory which is administratively governed by the government of the given country and within which persons, goods and capital can move freely; it does not include territorial enclaves of other countries (embassies, military bases, etc.) or international organisations but includes the enclaves of this country in the territory of other countries.

The System of National Accounts (SNA) is a system of interrelated indicators used to describe and analyze macroeconomic processes.

The key indicator of the SNA is the **Gross Domestic Product (GDP)** which characterizes the value of goods and services produced in the country by all economic activities and intended for final consumption, capital formation and net exports.

GDP can be calculated in three ways: from the production side, the expenditure side, and the income side.

GDP from the production side is calculated as the sum of values added of economic activities and net taxes on products.

GDP from the income side reflects distributive transactions directly related to the production of goods and services (compensation of employees, taxes on production and imports less subsidies) the balancing item of which is gross operating surplus and gross mixed income. It is defined as the difference between GDP calculated with the production method, compensation of employees and net taxes on production and imports.

GDP from the expenditure side represents the total final consumption expenditure of households, government and non-profit institutions serving households (NPISHs), gross capital formation and net exports of goods and services.

The SNA accounts are constructed on a double-entry basis, i.e. receivables are recorded as resources, while payables are entered as uses. The difference between resources and their uses constitutes the balancing item which is shown on the resources side of the following account.

Brief description of accounts

The goods and services account records the total resources of goods and services in the economy as a whole as well as the uses of these resources.

On the resources side, the output of goods and services, imports of goods and services, taxes on products less subsidies are reflected.

Uses consist of intermediate consumption, final consumption expenditure, gross fixed capital formation, changes in inventories and exports of goods and services.

There is no balancing item in this account, i.e. resources are equal to uses.

The production account records transactions directly linked to the production of goods and services.

Under resources, the output of goods and services and taxes on products less subsidies on products are recorded. Under uses, intermediate consumption of goods and services is reflected. The balancing item is the gross value added.

At the level of the total economy, the balancing item of the production account is **GDP**, which characterizes the final result of production activity of the resident institutional units.

The generation of income account records distributive transactions which are directly linked to the production.

The resources show the gross value added (GDP at the level of the total economy).

The uses reflect expenditures of producers out of the gross value added: compensation of employees and taxes on production and imports less subsidies.

The balancing item here is **gross operating surplus and gross mixed income**.

The allocation of primary income account shows how primary income received from the production activities or property is distributed between institutional units or sectors and the rest of the world. It is not directly linked to the production process.

The resources consist of gross operating surplus and gross mixed income, compensation of employees, taxes on production and imports less subsidies on production and imports, and property income receivable.

The uses consist of the property income payable.

The balancing item here is the **balance of primary income**.

At the level of the total economy the resources of this account consist of GDP and property income receivable from the rest of the world, while uses reflect only property income payable to the rest of the world. The balancing item here is the balance of primary income for the economy as a whole which is called **gross national income (GNI)**.

The secondary distribution of income account reflects the income distribution and shows how the balance of primary income of an institutional unit or sector transforms into disposable income through current transfers, other than social transfers in kind, receivable and payable.

Resources here show the gross national income and current transfers receivable from the rest of the world.

The uses show the transfers payable to the rest of the world.

The balancing item here is the **gross disposable income** which is intended for final consumption and saving.

The redistribution of income in kind account reflects the redistribution of income and shows how disposable income of households, NPISHs and government transforms into their adjusted disposable income taking into account social transfers in kind receivable and payable.

The resources show the gross disposable income of the institutional sectors and social transfers in kind receivable by the household sector.

The uses show social transfers in kind payable to the household sector.

The value of social transfers in kind equals to the sum of final consumption expenditure of general government providing individual services and of NPISHs.

The balancing item is the **gross adjusted disposable income**.

The use of gross disposable income account shows how households, government and NPISHs distribute their gross disposable income between final consumption expenditure and gross saving.

The gross disposable income is carried forward from the secondary distribution of income account and recorded in resources.

The uses show final consumption expenditure.

The balancing item of the account is **gross saving**. It represents that part of gross disposable income that is not spent on final consumption of goods and services.

Gross saving may have a positive or a negative value depending on whether disposable income exceeds final consumption expenditure or vice versa.

The use of adjusted disposable income account shows how gross adjusted disposable income is distributed between actual final consumption and gross saving in household, general government and NPISH sectors.

Gross adjusted disposable income is brought forward from the redistribution of income in kind account and recorded under resources.

Actual final consumption is recorded under uses.

The balancing item of the account is **gross saving**. It has the same value as in the use of gross disposable income account.

The capital account reflects the value of non-financial assets acquired or disposed of by resident institutional units as a result of transactions and shows changes in the net capital (acquisition less disposal) through saving and capital transfers.

The main source of financing of capital transactions is gross saving, which is brought forward from the use of gross disposable income account. Other sources of funding these transactions are capital transfers receivable less capital transfers payable.

The balancing item of the account is **net lending (+)** or **net borrowing (-)**.

The rest of the world account reflects all transactions between the institutional units of a given country (residents) and institutional units of other countries (non-residents) that took place during a reference period.

The rest of the world account covers activities of non-residents as related to their interaction with residents. Transactions between residents and non-residents are also reflected in the domestic economy accounts, but there they are not separated from the transactions between residents.

The rest of the world account includes the following external accounts:

- the external account of goods and services;
- the external account of primary income and current transfers;
- the external capital account

The feature of the external accounts is that the resources and uses are shown from the point of view of the rest of the world, i.e. of other economies.

Brief explanation of the accounts aggregates

Capital transfers are transactions where an institutional unit transfers gratis assets, in cash or in kind, to another unit, normally for investment purposes. Capital transfers are usually nonrecurrent and considerable in value transactions connected with assets acquisition or disposal. They include taxes on capital, investment subsidies, and other capital transfers.

Changes in inventories is the difference between opening stocks and closing stocks valued at average market prices of the period in question in order to eliminate price effects. Includes changes in productive stocks, work-in-progress, finished products and goods and state material reserves.

Compensation of employees covers wages and salaries and social insurance contributions. It is recorded on the basis of accrued amounts, i.e. before taxes and other deductions in accordance with the legislation of the Republic of Belarus and reflects the compensation of all employees of resident organizations, regardless of whether these employees are residents or non-residents.

Current transfers include the following major types: taxes on income, profit, property and the like; state social insurance contributions, social insurance benefits, and other current transfers.

Final consumption expenditure consists of household final consumption expenditure, general government final consumption expenditure on individual goods and services and collective services, and also final consumption expenditure of non-profit institutions serving households. Such grouping shows which sector pays for final consumption.

Final consumption expenditure of non-profit institutions serving households is expenditure incurred by public organizations on consumption goods and services to be provided to households free of charge, including health, education and cultural services provided by organizations to their employees.

Financial intermediation services indirectly measured (FISIM) is the accumulation of temporarily spare funds of institutional units by banks and other non-bank credit and financial institutions and lending them to other institutional units.

General government final consumption expenditure on collective services consist on expenditure incurred by general government on services that meet the needs not of individual households, but of the society as a whole or of selected population groups (defence, public administration, roads, science).

General government final consumption expenditure on individual goods and services consists of expenditure incurred by general government on consumption goods and services intended for individual consumption and financed from the budget.

Gross disposable income is defined as income left at the disposal of resident institutional units for final consumption and gross saving. It is equal to the sum of gross national income and current transfers receivable less income payable as current transfers.

Gross domestic product is the value of goods and services produced in an economy by all economic activities and intended for final consumption, capital formation and net exports.

Gross fixed capital formation is defined as resident units' investment in fixed capital with the purpose of using it in production to generate new income in future.

Gross national income (GNI) is the total primary income receivable by resident institutional units plus the balance of primary income receivable from the rest of the world. The difference between GNP and GDP is equal to the difference between the total primary income receivable from other countries and the total primary income payable to other countries.

Gross operating surplus is the part of gross value added which remains with producers after deducting the outlays related to the compensation of employees and taxes on production and imports.

The surplus generated as a result of production activities of organizations established by households is referred to as **gross mixed income** because it includes the component of labour remuneration which is inseparable from the owner's income.

Gross regional product (GRP) is the value of goods and services produced in a region by all economic activities and intended for final consumption, capital formation and net exports.

When summed up, the GRPs of regions differ from GDP by the share not distributed by regions (further referred to as unallocated share), taking into account the lack of information at the regional level which is available at the national level only.

Gross saving is the part of gross disposable income which has not been spent on final consumption of goods and services.

Gross value added (GVA) is the output less intermediate consumption; calculated by economic activities.

Household final consumption expenditure consists of expenditure incurred by households on consumption goods and services to meet personal needs. Household final consumption expenditure consists of purchases of (consumption) goods and services, final consumption of goods from income received in kind (other than social transfers in kind), and consumption expenditure of goods and services produced by households for own final consumption.

Intermediate consumption is the value of goods and services consumed in the process of production over the reference period. The intermediate consumption does not include the consumption of fixed capital.

At the level of the total economy, the intermediate consumption also comprises, as a separate item, the consumption of financial intermediation services indirectly measured.

Kind of economic activity is a process where material resources, equipment, labour, and technology are combined in such a way that this results in the production of a homogenous set of products (goods or services).

Labour productivity is a measure of effectiveness of production which characterizes the output or the gross value added per unit of labour. For the economy as a whole, it is calculated as a ratio of GDP (GVA) to the number of employed population. To show the dynamics, the labour productivity index is calculated as a ratio of the volume index of GDP (GVA) to the index of employed population.

Net exports of goods and services are defined as the difference between the values of exports and imports of goods and services and include the turnover of the trade of Belarus with foreign countries, including the CIS countries.

Net lending (+) or net borrowing (-) is the difference between the net capital as a result of saving and capital transfers and net acquisition of non-financial assets (acquisition of non-financial assets less disposal, less consumption of fixed capital). A negative value represents net borrowing. It shows the value of resources that can be lent or should be borrowed. At the level of the total economy, net lending or net borrowing show the value of resources payable to the rest of the world or receiveable from the rest of the world.

Net taxes on products are taxes on products less subsidies on products.

Non-observed economy is a part of the national economy which includes the production, circulation and use of goods and services not covered (or not fully covered) by the state statistical surveys and represents the hidden, informal and illegal economic activities.

Other taxes on production are taxes related to the use of production factors (land, assets, and labour force) as well as the state duty for granting a special permission (license) to carry out selected activities, or other compulsory payments required for the resident to carry out economic activity.

Output of goods and services is the total value of goods and services which are the result of economic activities of residents in a reference period.

Production sector consists of the following economic activities: agriculture, hunting and forestry; fishery; mining and quarrying; manufacturing; electricity, gas and water supply; and construction.

Property income is income receivable by institutional units from putting the financial assets and non-financial non-produced assets at the disposal of other institutional units (income from property leasing, selling of licenses, use of natural resources, acquired goodwill).

Service sector includes trade, transport and communications, financial activities, education, health and social work activities, etc.

Subsidies are current unrequited payments from the budget to organizations provided these organisations produce particular goods or services.

Subsidies on products are subsidies given for a unit of a good produced or service provided, that is proportionally to the quantity or value of produced and sold goods and services or those imported by resident units.

Taxes on products are taxes payable proportionally to the quantity or value of goods and services produced and sold or imported by resident units. Taxes on products include the value added tax (VAT), excise taxes, customs charges, import customs duties, etc.

Transfer is defined as a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart. There are current and capital transfers. They may be either in cash or in kind.

Unallocated share is the gross value added of non-market services provided by the general government sector to the society as a whole (defence and public administration) and other non-market services financed out of the republican budget; taxes on products payable to the republican budget and subsidies on products paid out from the republican budget of the Republic of Belarus.

Institutional sectors

The **sector** is a grouping of institutional units which are homogeneous in terms of their functions in the economy and sources of funding, which implies their similar economic behaviour.

Institutional units are grouped into the following sectors: the non-financial corporations, the financial corporations, the general government, the households, and the non-profit institutions serving households. The institutional units that are residents of other economies form the rest of the world sector.

The non-financial corporations sector is composed of institutional units whose main function is the production of market goods or non-financial services to be sold on the market and generate profits. The resources of these units are primarily obtained from sales of goods and services, but some expenses can be subsidized from the budget.

The financial corporations sector consists of institutional units engaged in financial intermediation or in auxiliary financial activities on a commercial basis. Their resources are obtained from the liabilities incurred and interest received, insurance premiums and commission fees.

The general government sector consists of institutional units which provide primarily non-market services (or produce goods) for individual or collective consumption and redistribute income. Resources of these units are obtained from taxes and contributions paid by units of other sectors as well as from property income.

The household sector consists of all natural persons in the economy, whose main function is the supply of labour force and final consumption, as well as the production of goods and services for sale and personal use. The institutional unit in the household sector may consist of one or several individuals.

The sector of non-profit institutions serving households comprises institutional units providing non-market services to households (public associations, artistic and trade unions, religious organizations, charitable foundations; structural units of organizations providing health, education and cultural services (departmental hospitals, clubs, stadiums and the like)), whose main source of funds are membership fees and organisations' funds.

Principles of valuation

Economic transactions in the SNA are recorded on an accrual basis at current prices.

Market price (purchaser's price) is the amount paid by the purchaser for the delivery of a unit of a good or service. It includes any trade and transport charges and taxes on products (except value-added tax) less subsidies on products.

In order to eliminate the effects of various tax rates and subsidies on the structure of production and generation of income, the value added by economic activities is estimated at basic prices.

Basic price is the price receivable by the producer for a unit of a good or service less any taxes on products, and plus subsidies on products (except subsidies on imports).

In the SNA methodology, the intermediate consumption and changes in inventories are estimated excluding **holding gains (losses)**, which are defined as the value of products receivable by the asset owner as a result of price changes due to inflation. Under the conditions of inflation holding gains (losses) can be rather substantial.

Revaluation at constant prices is made both for GDP produced and for its uses. Prices of the previous year are used as constant prices. Revaluation of GDP production aggregates at constant prices is made with a double deflation method where the gross value added at constant prices is derived as the difference between the output and intermediate consumption valued at constant prices.

Revaluation of output and intermediate consumption at constant prices is made with two methods:

- deflating of data at current prices for the accounting period for a specific economic activity with corresponding price indices.
- extrapolating of data at current prices for the base year for a specific economic activity with volume indices or physical indicators adequately reflecting trends in this economic activity.

GDP (GRP) deflator index is the price index of all final goods and services the value of which is included in the GDP of the country of region. It is a ratio of the nominal GDP (GRP) at market prices of the current year to the real GDP (GRP) at the prices of the base year.

The statistical discrepancy between the GDP produced and GDP consumed shows the discrepancy between the GDP values calculated with different methods: as a sum of values added of economic activities and as a sum of final consumption expenditure, gross accumulation and net exports of goods and services.

International comparisons of gross domestic product

The International Comparison Programme (ICP) of gross domestic product provides comparable prices and quantitative measures in different countries by components of GDP use.

The Republic of Belarus takes part in the International Comparison Programme on a regular basis since 1993 (ICP rounds of 1993, 1996, 2000, 2005, 2008, 2011 and 2014).

The international GDP comparisons should meet the following three conditions:

- the economic substance of GDP must be unified for the countries;

- GDP must be expressed in the same currency;
- prices of goods and services must be comparable.

The national GDP estimates of the countries participating in the international comparisons meet the first requirement. However, these estimates do not meet the second and/ or the third requirement because they are expressed in national currencies and are calculated on the basis of national prices. These two requirements are met by using purchasing power parities (PPPs).

Purchasing power parity represents a number of currency units needed to buy a standard set of goods and services which can be purchased for one currency unit of the basic country (or for one unit of currency common to a group of countries). PPP is used for the recalculation of value indicators in national currency, such as household final consumption expenditure, main GDP components and GDP into a single currency.

As the comparison results can be normally obtained not earlier than two years after the ICP round, in compliance with the international practice the interim PPP estimates of the national currency at the level of GDP in the years between rounds are computed using the **global extrapolation method**. Herewith, the PPP of the base ICP year remains the same. The time series of GDP at PPP are updated continuously taking into account the latest changes in data and are also revised after the results of the next ICP round have been finalized, which complies with the international practice.
